

PT. SMART CAKRAWALA AVIATION

WORK ORDER

Form: SCA/MTC/030

Subject : Inspection Document 21 & Document 22	No.	WO/029-SNJ/VIII/2022
	Date	25 August 2022
	A/C Reg.	PK-SNJ C208B-5640
Reference : MP C208B Rev. 12	Prepared By	TS
	Checked By	CI
	Approved By	TM
To : Engineer In Charge		
Description : <ol style="list-style-type: none">1. Perform Inspection Document 21 & 22 Transponder and Pitot Static Alt. Test2. Make an entry in Maintenance Log.3. Return the Completed Work Order and Form to PPC. <p>#If any finding, please close the routine card, and transferred to inspection card.</p>		
Additional Work :		
Compliance Statement Carried out	Sign & Date Company Lic. No.: SCA 27 (Engineer In Charge) 28/08/2022	Signature (Technical Manager)

RETURN TO SERVICE

The work recorded above has been carried out in accordance with the requirements of the Civil Aviation Safety Regulation for the time being in force and in that respect the aircraft is consider fit for Release to Service.

Name	:	WAHYONO	Stamp	:	
Signature	:		Place/Date	:	Nabire, 28-08-2022

between the air pressure in the static pressure system and the true ambient static air pressure for any flight configuration.

- (6) Examine the drain valve(s) for condition, water in static system, and security of installation.

CAUTION: Do not open the autopilot drain plugs unless moisture is found in the left static system drain valve. If the autopilot static drain plug is removed to drain moisture, you must do a static system check after you install the plug.

- (7) Examine the drain valve(s) tubing connections for condition and security.
(8) Connect external electrical power to the airplane.
(9) Set the External Power Switch to BUS.
(10) Set the Battery Switch to ON.
(11) Set the Avionics Switches 1 and 2 to ON.
(12) Do a self-test on the air data test set and record the leak rate for future use.
(13) Connect the air data test set to the left pilot's pitot/static probe in accordance with the manufacturer's instructions.

CAUTION: Make sure that the static system pressure is not more than pitot system pressure, or instrument damage can occur. Do not apply pitot pressure to the static system or a vacuum to the pitot system. Do not do a leak test of the pitot and static system with soap and water or other liquids.

CAUTION: Do not apply power to pitot probes when the test adapters are installed.

NOTE: The pressure sensors inside of the GDC 74 are internally heated and must stabilize before the test. The G1000 / Air Data System must be powered on for a minimum of 15 minutes before you take calibration readings.

- (14) Push in on the BARO correction knob on PFD1 and make sure that the pressure display reads 29.92 IN (1013 HPA).
(a) Set the barometric setting on the standby altimeter to 29.92 IN.
(15) Use the air data test set to increase the pressure to the left pitot systems to generate the airspeeds (A/S) shown in Table 601. Record the airspeed displayed on the PFD and the standby airspeed indicator.

Table 601. Airspeed Display Check

Input Airspeed	Airspeed Indication Limit on PFD1	Airspeed Indication on PFD1	Airspeed Indication on PFD2	Airspeed Indication Limit on Standby Airspeed Indicator	Airspeed Displayed on Standby Airspeed Indicator
100	100 ± 2 kts	99, 2	100	100 ± 4 kts	100
125	125 ± 2 kts	125	125	125 ± 4 kts	124
150	150 ± 2 kts	150	150	150 ± 4 kts	150
175	175 ± 2 kts	175	175	175 ± 4 kts	175

NOTE: Airspeed tape changes to RED above 175 KIAS.

- (16) Slowly increase the pressure and make sure that the airspeed warning horn gives an audible sound at 178 KIAS, +3 or -3 KIAS.
(17) Slowly decrease the pressure and make sure that the airspeed warning horn sound stops at 178 KIAS, +3 or -3 KIAS.
(18) With the test set input set at 175 knots do the leak check on the system.
(a) After 1 minute the maximum allowable loss must not be more than 5 knots.

NOTE: The aircraft's leak rate is determined by subtracting the recorded test set's internal leakage.

- (19) Set the altitude on the test set to the values shown in Table 602.

Table 602. Altitude Display Check

Test Set Altitude Input	Altitude Indication Limit	Altitude Indication PFD 1	Altitude Indication PFD 2	Standby Altimeter Reading Indication Limit	Standby Altimeter Reading Indication

1,500 ft	1,500 ± 25 ft	1510	1505	1,500 ± 25 ft	1500
10,000 ft	10,000 ± 80 ft	10.005	10.000	10,000 ± 80 ft	10.000
25,000 ft	25,000 ± 155 ft	25.000	25.000	25,000 ± 155 ft	25.000

- (20) Slowly apply suction until the altimeter shows a 1000- foot (304.800 m) increase in altitude.
- Close the suction source to keep the system closed for one minute.
 - Make sure that the decrease in altitude is not more than 100 feet as shown on the altimeter.
 - If the leakage rate is within tolerance, slowly release the suction source.
 - If the leakage rate is more than the maximum permitted rate, tighten all the connections and do a leakage test.
 - If the leakage rate is still more than the maximum permitted rate, do the steps that follow:
 - Disconnect the static pressure lines from the airspeed indicator and the vertical speed indicator.
 - Use the correct fittings and connect the pressure lines together so the altimeter is the only instrument connected to the static pressure system.
 - Do a leak test to find whether the static pressure system or the bypassed instruments are the cause of the leakage.
- (21) Do the test again for the right pitot/static system using PFD2. Record the data in Table 601 and Table 602.
- NOTE:** The standby altimeter and airspeed indicators are not connected to the right system.
- (22) Slowly return the pitot/static system to the field elevation.
- (23) Remove the air data test set in accordance with the manufacturer's instructions.
- (24) Set the PITOT-STATIC HEAT switch to ON for 30 seconds, then OFF.
- NOTE:** The pitot tubes have two heating elements, one in the front of and one behind the static port compensating ring. Make sure that both elements are operating.
- WARNING:** Use extreme caution when you touch the pitot tube surface with you bare hands. The pitot tube will cause severe burns to skin if it is left on too long.
- (25) Carefully make sure that the pitot tube becomes warm when the PITOT-STATIC HEAT switch is at the ON position.
- (26) Set the Avionics Switches 1 and 2 to OFF.
- (27) Set the Battery Switch to OFF.
- (28) Set the External Power Switch to OFF.
- (29) Remove the external electrical power from the airplane.
- (30) Do the Restore Access.

G. Do a Functional Check of the Pitot/Static Systems (Alternate Method). Refer to Figure 601.

- Examine the pitot tube(s) and the static port(s) for condition, corrosion, and obstructions.
- Examine the mast(s) for condition, bends, and damage.
 - Make sure that the sealant at the mast-to-wing joint is in good condition.
- Examine all pitot/static system plumbing for condition and security.
 - Make sure there are no low spots in the tubing that would cause water to collect.
- Make sure that there is no moisture and/or restrictions caught in the static system.
- Make sure that there are no alterations or deformations of the airframe surface that would affect the relationship between the air pressure in the static pressure system and the true ambient static air pressure for any flight configuration.
- Examine the drain valve(s) for condition, water in static system, and security of installation.

CAUTION: Do not open the autopilot drain plugs unless moisture is found in the left static system drain valve. If the autopilot static drain plug is removed to drain moisture, you must do a static system check after you install the plug.
- Examine the drain valve(s) tubing connections for condition and security.
- Connect external electrical power to the airplane.
